

Server Edition

Tomorrow's success stories will be those companies that quickly adapt to online business processes using the latest and most sophisticated technology.

Integration between customer-facing systems and back office systems is now vitally important - a bank or e-tailer cannot operate effectively online without the ability to quickly execute transactions, pulling information from disparate back-end systems and merging it for cohesive presentation.

ApatrixConnect is a pure Java solution that provides secure links to data from a huge variety of remote systems, leveraging existing standards and protocols. Developed by integrated web solutions supplier Presence Online, ApatrixConnect provides an ideal solution for e-commerce integration requirements. A robust, scalable and enterprise-wide solution offering superior connectivity for integrating web applications and e-business solutions, ApatrixConnect leverages powerful back-end integration and application components and combines these with a content management and web-publishing environment such as Apatrix.

ApatrixConnect is the crucial glue that allows companies to connect to one another and to web marketplaces. □

□

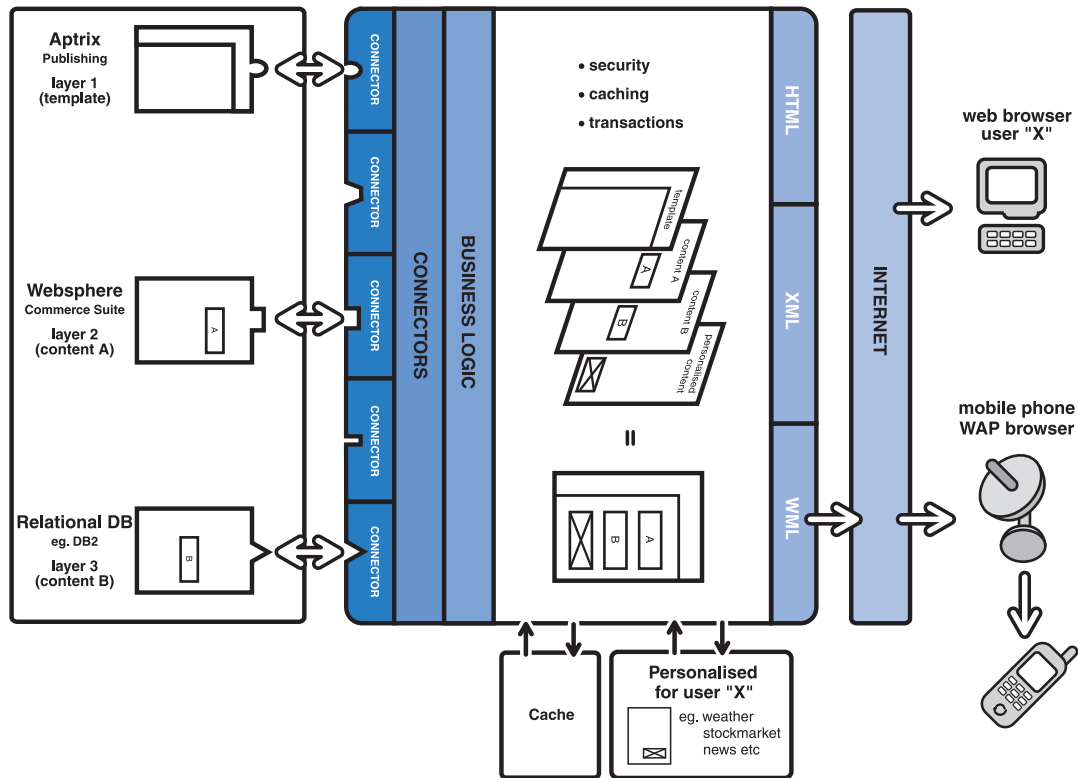

BENEFITS

- Get to market faster, and provide greater functionality, by □ integrating existing assets and processes with your e-business solution.
- Leverage your existing core back-end systems, databases and other information sources.
- Aggregate content and wrap within a design template, ensuring consistency and familiar branding.
- Site performance can be dramatically improved using intelligent caching strategies.
- Leverage existing security assets while providing a single entry point for users to multiple back-end systems.
- User behaviour can be logged and tracked even when viewing external content.
- Configurable using XML-based system settings and properties.
- Excellent logging.
- Runs on platforms that comply with the Java 2 specification, providing superior robustness and performance.

AprixConnect presents a framework for the rapid integration of web applications with core back-end systems, various servers and other information sources.

FEATURES

Presentation and delivery of aggregated content

- Provides a platform for conducting transactions requiring access to both core back-end systems such as SAP and concurrent aggregation of content and presentation data from other sources.
- Connects to various systems and information sources including SQL databases such as DB2 and Oracle, XML repositories, web applications, application components and other web sites.
- Provides just-in-time parsing of HTML/XML data.
- Retrieves and integrates content from the information sources, and can embed multiple content components such as web pages 'within' another web page.

Integration of content from disparate systems

- Allows HTML templates to be specified for presenting or wrapping the content, enforcing a consistent look and feel and ensuring navigational consistency.
- Merges the resulting content, integrated from various sources, within the separate presentation layer.

Performance and caching

- Provides multiple mechanisms for caching information allowing fast retrieval by subsequent requests.
- Supports caching of content components retrieved from disparate systems and data sources on an application-wide level.
- Also supports the caching of personalised content uniquely tailored for individuals on a user session level.
- Provides flexible cache strategies for managing the cache, allowing the easy configuration of storage and expiration attributes for individual content components.

Security and Session Management

- Provides users a single sign-on point for accessing multiple back-end systems.
