

VANTAGE GIGA Advanced Analysis for Employee and Network Activity

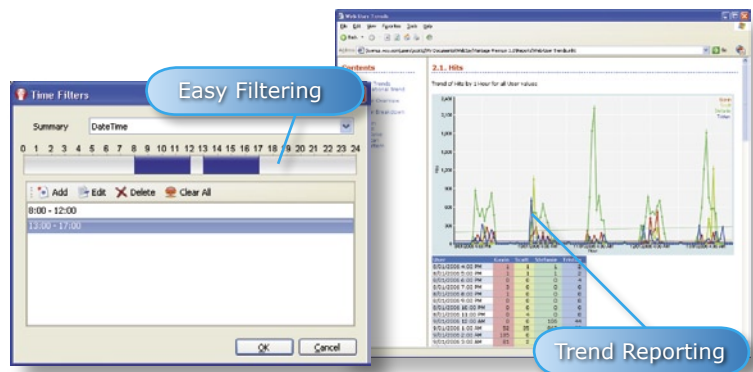

WebSpy Vantage Giga empowers IT to prudently manage network resources, plan capacity, enforce usage policies and validate service levels. For the business, Vantage provides valuable employee productivity and compliance reports.

Vantage Giga's key attribute lies in its ability to import and translate different types of log files, providing powerful, yet easy to use, drill down analysis capabilities with a comprehensive choice of meaningful reports.

Features

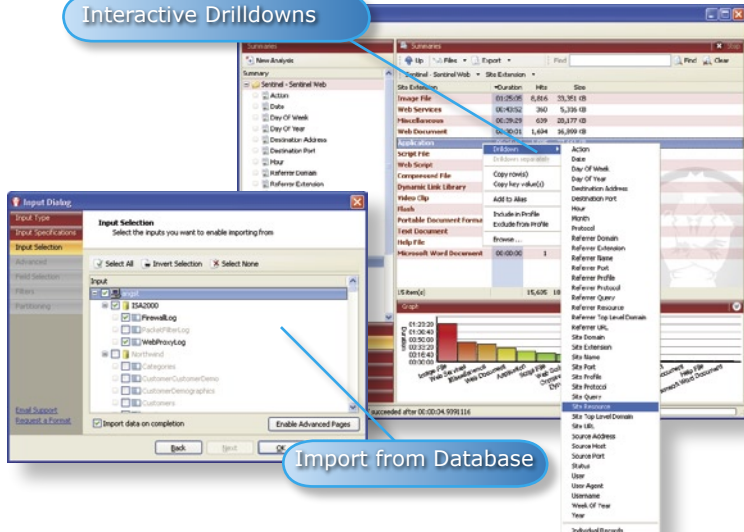

- **Simple installation and set up**
Typically installs to your desktop (server if required) and simply imports log files from any network device. Average set up takes less than 15 minutes.
- **Imports many types of log files**
Import and analyse an **unlimited amount** of log files from numerous network devices, including proxy servers, firewalls, routers and QOS appliances. Vantage Giga also imports text based log files, compressed or zipped log files, and data stored in SQL databases.
- **Logical analysis for your log file data**
Vendor log files contains numerous 'types' of information that need to be analyzed differently - something traditional data analysis tools have struggled to deliver. Vantage Giga uses a WebSpy developed "schema" system to analyze different types of log files sensibly and logically.
- **Unrivalled data drilldown interrogation**
Interactively drilldown from one summary to another. For example, drilldown from websites through to users, source addresses through to specific ports, or email subjects through to senders and recipients.
- **Tailored reporting to suit individual needs**
Choose from numerous template reports or simply create your own. Generate quick Comparison Reports, detailed Network Data Analysis Reports, or view traffic patterns over time with Trend Reports. All reports are available in HTML, Word or text formats.

- **Represent data meaningfully using aliases**
Represent email addresses and computer names with a 'Username' alias, add users to a 'Department' alias, or group IP addresses using subnet expressions such as 192.168.0.0/24. Vantage Giga provides a choice of multiple, customizable aliases.
- **Simple user and department name identification**
You can import user and department information from any LDAP compatible directory service, such as Microsoft Active Directory.
- **Identify business or recreational use**
Vantage Giga provides website and URL categorisation technology to identify unacceptable and acceptable Internet use. This customizable, keyword based approach allows organisations to decide what is unacceptable, according to values specified in the prevailing Internet Usage Policy.

- **Set and forget tasking**
Importing of log files, generating reports and many other common tasks can be set to run overnight or at a time to suit your busy day.
- **Optimize analysis performance for your organization**
Every organization's analysis requirements are different. That's why Vantage Giga puts you in control of how you import and analyse your data to maximise performance. Choose from features such as Storage Partitioning, Advanced Filtering, Analysis on Import (pre-calculated analysis), and Fields/Summary Exclusions to increase performance.

Interactive Drilldowns

Minimum Requirements

- Microsoft® Windows® 2000, XP, or Server 2003
- Microsoft® .NET Framework 2.0

Recommended Requirements

- 2 GHz CPU or faster
- 512 MB RAM or above
